

CaseBuilder Incident Reporting and Management System

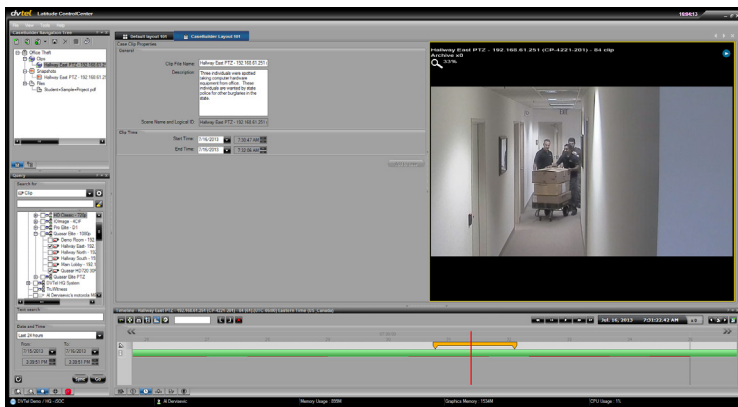

The CaseBuilder Incident Reporting and Management System is an evidence reporting and risk management tool designed to replace traditional paper-based systems. CaseBuilder is an excellent organizational tool that provides users with the ability to build a case about an event by collecting, organizing and grouping all data (pictures, clips, files) into a single location.

CaseBuilder is part of the Latitude Network Video Management System (NVMS) platform. Once a user creates a case, a name is given to the case (for later queries, browsing and editing). The user can insert files that support the case (clip, text file, snapshot, etc.). Once saved, the case can be edited to include more files, or exported to share with law enforcement or other agencies.

Features

- Builds “Case Files” with archive video, photos, text and other file attachments.
- Embedded in Latitude’s ControlCenter as a predefined workspace mode allowing for seamless operation.
- Cases can be exported to portable media for offline investigations.
- Accessible only to privileged users.

Without CaseBuilder—it’s just raw data.

CaseBuilder Benefits:

- Incident tracking, reporting and analysis
- Intuitive video search and event recording
- Automatic report numbering
